

Sales One Project – Phase Two: Update Messaging

Set Up - GIT

Create a GIT repository for all of the updates we have made so far. We will use branches in the next few updates and for when we start implementing Java (Sales Two Project)

Make sure the GIT repo has all of the different files and folders required.

JavaScript File: messages.js

In the js folder, create a file called “message.js” if it doesn’t yet exist and add the file to index.html, salesrepresentative.html, and customers.html. The functionality created will be used in subsequent JavaScript files, so place it in the html files appropriately.

Create a messaging function in message.js that takes a parameter for a message, a message class (css class), and a parameter for an element ID. The messaging function should take the message and update the innerHTML for the element with that ID in the HTML file and add the class to the element.

index.html

Update the error message area appropriately for the login error message in **index.html**. Make sure the paragraph/element is in the correct place, and the class is in the css file. This should be a blank div or paragraph, with an id for the message logic to update with the message and a class. Call this new function in the login function instead of coding the paragraph message. Make sure that the class for the text color or background is in the css file.

Update salesrepresentative.html appropriately to use the messaging function when loading the screen; update the HTML appropriately to have only a blank paragraph or div in the appropriate area, pass in the message and the class. Ensure the class is in the css file.

customers.html

Do the same for the message on the customers file.
