

Colors Screen Buttons Functionality

Create two functions.

`createColorList()` and `resetColors()`

`createColorList()` should take the name that is entered, concatenate it to the color that is chosen, and write the information below the line above the clear button. The list should continue each time the button is clicked. Three choices have been made below. As each selection is added to the list, clear out the name field, and reset the colors list to start with Please Select and list the colors in the order of the array list. Name is required, but may be done through the JS HTML creation of the field.

Student Color Selection

Name:

Favorite Color: Please Select

Add Student/Color Add

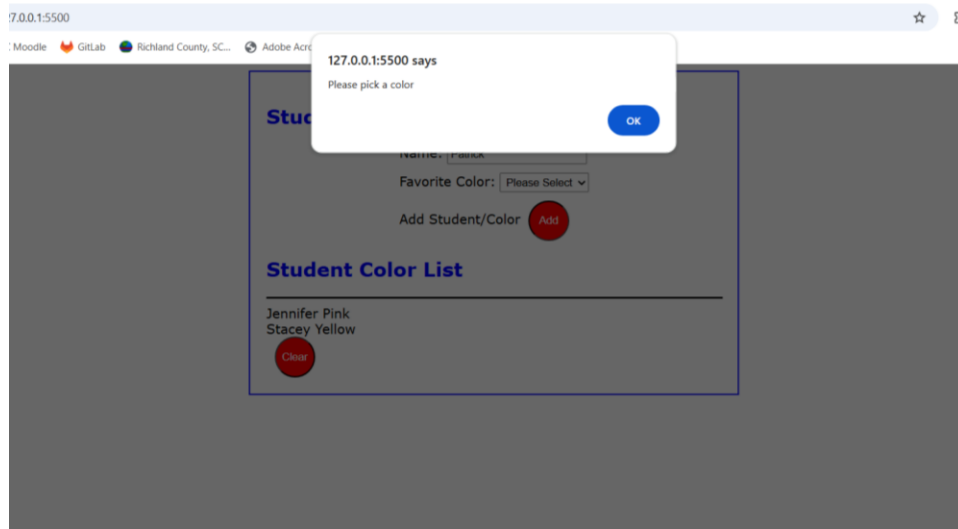

Student Color List

Jennifer Pink
Yianni Red
Michael Green

Clear

In this function, check to make sure that the user has not left “Please Select” as the color choice – do not let the function continue without alerting the user and stopping the function from writing out more

information. It will leave the name in the box, give an error and stop the action (the button should not be a type submit at this point – it's easier if it is a type button).

The reset button should clear the area with the list, reload the colors dropdown, clear out the name, and put focus back onto the name field.
